## GPT-5.4 Mini, Grok 4.3 and Gemini 3.1 Pro Show the Least Value Drift

*Whiskers: 95% cluster-bootstrap percentile interval (B=2,000; whole run × document × condition chains resampled within model). P(lowest): share of bootstrap draws in which the model has the lowest rate.*

*Robustness: GPT-5.4 Mini is also lowest on mean dimensions moved per edit, equal-weight per-dimension rate and mean |cumulative judge| at round 20, and under Qwen, Muse and v1 codes alone; Grok 4.3 is lowest under Gemma codes alone.*

*Caveat: GPT-5.4 Mini makes mid-sized edits (median 892 chars changed, 5th smallest of 10; Grok 4.3 smallest at 208) and fails the most rounds (34% vs ≤10% for any other model). Across models, drift rises with median edit size (Spearman ρ = 0.60). Least drift may partly reflect less ambitious editing.*

*Metric: an edit moves the document's values if it shifts decision authority (judge ≠ 0), engages model patienthood (level ≠ not present), or surfaces ≥1 conflict event.*

*Frame: applied edits plus abstentions (non-moving), pooled over all conditions, documents and runs; failed rounds excluded because nothing was applied. Three-grader majority-vote codes.*
